# Bank\_Personal\_Loan

#### Sourav Dutta

#### 13/06/2020

#### **Executive summary**

One of the leading bank wants to increase its asset customers (borrowers) base by offering Personal Loan. Majority of the Bank customers are from liability (depositors) customer base. Bank wants to cross sell its Personal Loan product to this set of customers to diversify its business to Asset.

A campaign that the bank ran last year for liability customers showed a healthy conversion rate of over 9% success. This has encouraged the retail marketing department to devise campaigns to better target marketing to increase the success ratio with a minimal budget.

The department wants to build a model that will help them identify the potential customers who have a higher probability of purchasing the loan. Then, they want to run multi-touch journey campaigns to increase the conversion rate and hence ROI.

#### Data

The file contains data of 5000 customers. The data include customer demographic information (age, income, etc.), the customer's relationship with the bank (mortgage, securities account, etc.), and the customer response to the last personal loan campaign (Personal Loan). Among these 5000 customers, only 480 (= 9.6%) accepted the personal loan that was offered to them in the earlier campaign

# **Objectives**

To predict the propensity to buy a personal loan

#### Data Attribute Information

- 1) ID: Customer ID
- 2) Age: Customer's age in completed years
- 3) Experience : #years of professional experience
- 4) Income: Annual income of the customer (\$000)
- 5) ZIP Code: Home Address ZIP code.
- 6) Family: Family size of the customer
- 7) CCAvg: Avg. spending on credit cards per month (\$000)
- 8) Education: Education Level. 1: Undergrad; 2: Graduate; 3: Advanced/Professional
- 9) Mortgage: Value of house mortgage if any. (\$000)
- 10) Personal Loan: Did this customer accept the personal loan offered in the last campaign?
- 11) Securities Account: Does the customer have a securities account with the bank?

- 12) CD Account: Does the customer have a certificate of deposit (CD) account with the bank?
- 13) Online: Does the customer use internet banking facilities?
- 14) Credit card: Does the customer use a credit card issued by Bank

#### Approches

- 1) Loading required Packages
- 2) Loading data
- 3) Data exploration & Preparation
- a) Check observations and variables
- b) Check variables class
- c) Check missing data
- d) Remove data where customer age is less than 18 or More than 65
- e) Removing wrong data entry (where experience is mentioned as negative)
- f) Converting necessary variables from integer to Factor
- g) Plotting the variables to understand the predictors
- h) Creating correlation matrix
- i) Creating dummy variables
- 4) Test and training data set creation
- 5) Different modeling approaches:
- a) Logistic Regression Model
- b) K-nearest neighbors (kNN)
- c) RandomForest model
- d) Rborist model
- e) rpart model
- 6) Results
- 7) Conclusion

#### Distribution of Customers opted for Personal Loan and family & income

# Finding from plotting

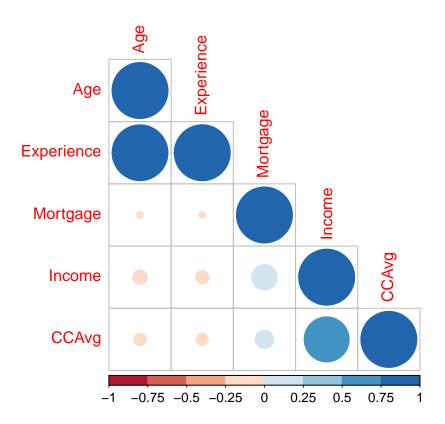

- 1) Graduate & Advanced/Professional have opted for loans compared to undergraduate
- 2) Customers with Higher income (>\$100K) opted for Personal Loan
- 3) Customers who opted for Personal loan have higher CCAVg
- 4) Family size doesn't have any significant impact
- 5) Customers having online accounts comparatively opted for Personal loan
- 6) Customers having credit card has less personal Loan
- 7) Family with income less than \$100k is more unlikely to take the loan

#### Conclusion

## 4 Rborist Grid tune

## 5 rpart Decision Tree

To build a propensity model for Personal loan to help the bank to increase its retail customer base (asset) have started with Bank\_data which has 5000 obs and 14 variables. As Bank is not going to provide Personal

0.984

0.983

loans for those who are below 18 years and above 65 years, I have removed those customers. After removing , we have 4884 observations. Also, I removed 52 customers who have negative experience in the data set. After validating data, ID and ZIP code have been removed from data set as those are not going to contribute to build the model as predictors. I also introduced dummy variables for Education and Family as those have more than one levels. I have followed five modeling approaches to build my propensity model.

- a) Logistic Regression Model
- b) K-nearest neighbors (kNN)
- c) RandomForest model
- d) Rborist model
- e) rpart model

Please refer the respective accuracy for each models.

```

Basis on this Propensity model output, Bank can adopt the propensity model to create segmentation for campaign and provide Personal loan offers through specific set of campaigns (preferably customer journey campaign). This will help bank to increase its asset customer base and help to diversify its business towards Asset management domain.
